OUR COMMITMENT TO SUSTAINABILITY

Every day, we work to reduce our environmental impact by implementing responsible measures that promote resource conservation, energy efficiency and respect for the environment, while maintaining the comfort and quality of our guests' experience.

- Energy-efficient lighting: 100% of our facilities are equipped with high-efficiency LED lighting. In addition, motion sensors are installed in communal areas to optimise lighting use and reduce electricity consumption.
- Water conservation and responsible use: Our showers and taps are fitted with flow restrictors that help reduce water consumption without compromising our guests' comfort.
- Elimination of single-use plastics: We promote more sustainable alternatives by replacing individual toiletry containers with refillable dispensers containing eco-friendly, biodegradable cosmetic products. This initiative also extends to our bar, restaurant and picnic services, helping to reduce plastic waste.
- Filtered water and reusable containers: Our restaurant serves filtered water in reusable glass bottles. The spa area also features a filtered water dispenser, helping to reduce disposable packaging and encourage more responsible consumption habits.
- Responsible waste management: We promote waste separation and the proper management of waste generated throughout our facilities, including paper and cardboard, glass, packaging, organic waste and used cooking oil, helping to ensure its recycling and recovery.
- Food waste prevention: We carefully plan our purchasing and food preparation to match quantities to service requirements, minimise food waste and make better use of available resources.
- Commitment to social and professional inclusion: We collaborate with inclusive work-placement programmes, offering people with disabilities the opportunity to gain professional experience and training in housekeeping roles. We believe in equal opportunities and in the importance of promoting social and professional inclusion within the hospitality sector.
- Renewable energy self-consumption: We support the use of renewable energy through self-consumption systems, helping to move towards a more sustainable energy model and reduce our dependence on conventional energy sources.
- Thermal energy and zero CO_2 emissions: According to the information provided by our supplier, the energy used for heating and cooling, supplied through the Ecoenergies network, has zero CO_2 emissions. This solution helps reduce the carbon footprint associated with climate control and thermal comfort throughout our facilities.

Our goal is to continue moving towards a more sustainable hospitality model by integrating environmental and social criteria into our daily operations and promoting responsible tourism that respects the environment.
